Traits

Communication Trait

- Articulation
- Clarity of Expression

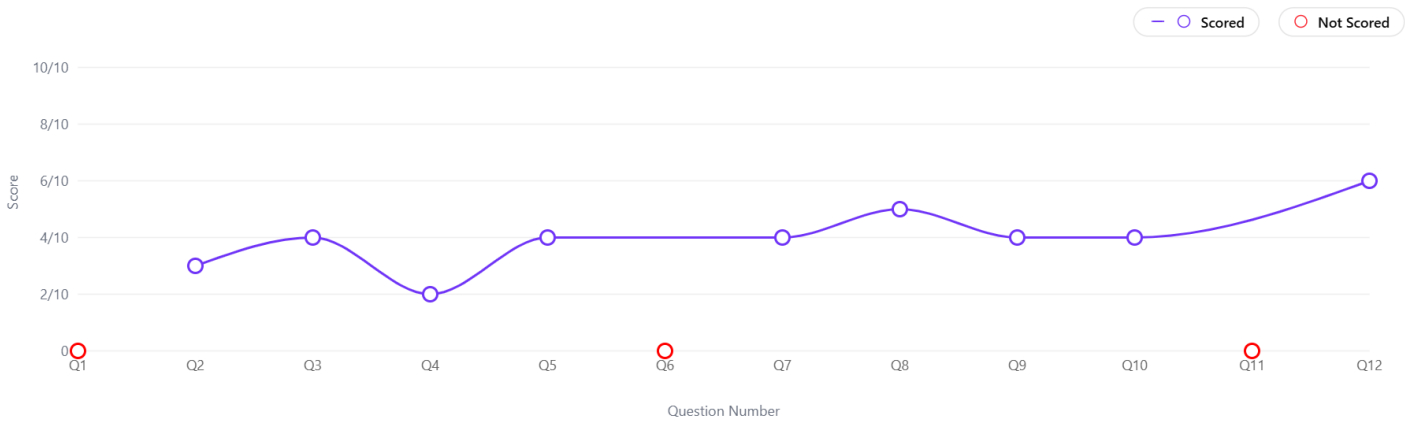
Behavioral Trait

- Growth Mindset
- Initiative
- Problem-Solving Approach

Veda AI Executive Summary

- Demonstrated understanding of API optimization techniques using Node.js and MongoDB.
- Communication lacked clarity and structure, making technical explanations difficult to follow.
- The candidate showcased a significant project in NPM, reflecting enthusiasm and initiative.
- Responses needed more depth regarding specific technical challenges and measurable outcomes.
- Opportunities exist to enhance structured communication using the STAR methodology for behavioral questions.

Performance Trend Over Questions



Interview Conversation Breakdown

Veda AI • 00:00:03

Q1 Hi Sagar, I'm Veda, your digital interviewer from HRFY.ai. Today's session will include a blend of questions about your background, projects, and key skills relevant to the Management Trainee position. I aim to create a comfortable environment for you to showcase your abilities and experiences. Whenever you're ready, we can get started!

Score: N/A

Your Answer • 00:00:29

Veda AI • 00:00:03

Q1 Hi Sagar, I'm Veda, your digital interviewer from HRFY.ai. Today's session will include a blend of questions about your background, projects, and key skills relevant to the Management Trainee position. I aim to create a comfortable environment for you to showcase your abilities and experiences. Whenever you're ready, we can get started!

Score: N/A

Your Answer • 00:00:29

Yeah. Please go ahead.

Veda AI • 00:00:30

Q2 Let's start with the interview, Tell me a bit about yourself and your family background. I'd love to understand the environment you grew up in and the people who shaped your early years ?

Score: 3/10

Your Answer • 00:01:25 Insights

Okay. Talking about mess my name is Sal. I'm currently I'm pursuing JUT And currently, I'm in. I'm talking about my family background. Yeah. It's it's something like I've learned a lot from my family and it's like something something like critical things like going on there. But, yeah. All I all I can say to you is I learned a lot in my family. I learned everything and trying to adopt and trying to achieve their goals.

To improve, the candidate should structure their response more clearly and provide specific examples of how their family has influenced them. Using the STAR methodology could help in articulating these experiences more effectively.

Veda AI • 00:01:29

Q3 What specific critical things did you learn from your family that have influenced your personal or professional goals?

Score: 4/10

Your Answer • 00:01:59 Insights

Something about, like, money, like, obviously, money matters if if we need to survive in this world and yeah. Obviously, to make them happy, my obviously, goal is to, like, work hard a lot. To achieve their goals.

To improve, the candidate should provide a specific example of a lesson learned from their family and explain how it directly influences their personal or professional goals. This would enhance clarity and demonstrate deeper self-awareness.

Veda AI • 00:02:03

Q4 Can you elaborate on how your understanding of money and its importance has shaped your approach to achieving your own goals?

Score: 2/10

Your Answer • 00:02:35 Insights

Like, it's it's getting personal. Like, how can I, like, those personal things like that? There's something like family matters, like, that. I couldn't share in this interview part. You didn't go up or you didn't talk about my technical issue. I cannot go deep into that. Sorry about that.

The candidate should work on articulating their thoughts more clearly and developing specific examples that relate to the question. Practicing structured responses could help in providing a more coherent answer in future interviews.

Veda AI • 00:02:37

Q5 Let's start with something from your project experience, In your experience optimizing Node.js/Express APIs at Bluephant, what specific trade-offs did you consider when aiming to reduce response time by 40%? Can you describe a particular debugging incident you faced during this process and how you resolved it?

Score: 4/10

Your Answer • 00:05:02 Insights

The thing was we even like, I use Redis and Redis. So eventually, it's doesn't, like, go directly signed to the back end. It's just take the response from the Redis and all The thing was the actual problem was were hitting so many request to the back. And it was taking so much of time, like, a lot And to reduce this, we also had, like, debouncing So we just added that a person can, like, go send only these request of if is sending the question again and again, asking again and again. Hitting that API again and again and and again, then we can block him eventually. And to reduce it, obviously, we use queue system. Eventually, I queue and heat system. To reduce this forty percent and the and how how did I label? Like, yeah, that's a good question. Like, every time, like, gonna say, like, our time I've checked in ad hoc section and the and think about that, how many request should we do. And is it is it necessary to, like, have extra request and all? That was the thing to reduce or to debug the to debug this. And talking about the response time. Yeah. Actually, I calculated using tools, like, yeah, it will eventually available online. And I also added a time response, like, start and ending So according to that, I actually, like, calculated or that's how it's come forty percent.

To improve, the candidate should focus on clearly articulating their specific role in the project, providing more structured explanations of the technical decisions made, and detailing the quantifiable impact of their optimizations on response times.

Veda AI • 00:05:11

Q6 Going a bit deeper, What specific metrics or tools did you use to measure the effectiveness of the optimizations you implemented, and how did you determine their impact on response time?

Score: N/A

Your Answer • 00:06:34

I mean, like, yeah, obviously, I use the q and d hash thing to reduce it or to optimize that thing as the first and fourth one, the hash and the index in the index in the MongoDB, like, eventually, index help us to help us to, like, search for the query of for the unique thing. Pretty fast too. And using MongoDB aggregation, it's also helped me like, reduce it and talking or the question how do I determine the impact of the on this concern over time? If possible, can you, like, explain what should I, like, tell you in the what's impact on this one stand? Like, I don't understand what do what am I supposed to, like, tell you about. This thing?

Veda AI • 00:06:39

Q7 Staying on this point, Can you clarify how you utilized MongoDB aggregation specifically to improve the performance of your API, and what results you observed from that implementation?

Score: 4/10

Your Answer • 00:07:51 Insights

Oh, let's say I use or the aggregation I use, Swine. So Ropa and all and other things. So depending on the depending on that collection, I cannot depending on the schema, I cannot, like, go randomly tell you about the schema because Eventually, I don't remember that, but for that, like, remember is so any projects you are test cases and bunch of bunch of test cases and for that, I guess, I've I've been implemented group by aggregation and the joining. And this is how I, like, go improve my response of API and the

Your Answer • 00:07:51 Insights

Oh, let's say I use or the aggregation I use, Swine. So Ropa and all and other things. So depending on the depending on that collection, I cannot depending on the schema, I cannot, like, go randomly tell you about the schema because Eventually, I don't remember that, but for that, like, remember is so any projects you are test cases and bunch of bunch of test cases and for that, I guess, I've I've been implemented group by aggregation and the joining. And this is how I, like, go improve my response of API and the what I observed from the implementation is the response and reduces a lot. Part. I think forty percent on top and more. Yeah. So that's it.

The candidate should work on articulating specific technical details and examples related to their project's architecture, particularly explaining the schema and how specific MongoDB aggregations contributed to performance improvements.

Veda AI • 00:07:54

Q8 Understood, During your internship at Bluephant, you mentioned optimizing Node.js/Express APIs. Can you describe a specific issue you encountered with API response times, how you diagnosed it, and what changes you made to improve scalability?

Score: 5/10

Your Answer • 00:09:39 Insights

Yeah. Like, the problem was whenever the front end hits the back end API, it's take lots of time to, like, send the response from the back end to front end. So that was the this that was a problem. To, like, fix this problem We obviously use the aggregation thing and the index thing, MongoDB application and the index TV to optimize it and talking about the scalable scalability, like, all we will not handling will not using AWS or Q and A or something. To handle the load. But eventually, we can use that load balance and all or depending on the Kubernetes to increase reports or increase the images of data of image and yeah. But initially in the blue part, what I did is yeah. Obviously, like, added the aggregation, MongoDB aggregation and the index TV. And, yeah, because of this, the response time increases, like, decreases Oh, sorry. Never. And this response time increases. So was effective and the response was the response from the back to front end was getting fast.

To improve, the candidate should elaborate on specific challenges encountered during the optimization process and provide quantifiable results of the changes made. Clear articulation of their specific contributions would also enhance the response.

Veda AI • 00:09:42

Q9 Building on that, Can you explain the specific role that load balancing and Kubernetes played in your approach to improving scalability, and what challenges you faced while implementing them?

Score: 4/10

Your Answer • 00:11:15 Insights

Problem on, like, the in the load balancing part, approach was something like I assume there are four work or the four parts. So and eventually, one part is or one worker or one part is like, has a lot of memorial, a lot of process going on in that part. So eventually, so what we actually did is we actually checked if the worker memory and the CPU CPU is pretty much high, then we just created a new board or a new worker and cancel all the load to that. It will again, the same problem occurs, like, the memory issue or the CPU issue. We again increase the parts and so on and so forth. And how we are increasing the ports, so we are using humanities because while actually port is it's kinda container. It's kinda like image. It's kinda docker image. We are running in the port. So yeah. We use Kubernetes to manage the images, proper pages.

The candidate should focus on clearly explaining specific technical challenges they faced, how they addressed those challenges with concrete examples, and the measurable impact of their solutions. Using structured communication to detail their role in the project would also enhance clarity.

Veda AI • 00:11:20

Q10 Going a bit deeper, Can you detail the specific metrics or thresholds you monitored to determine when to scale up the number of workers, and how did you ensure that the load balancing was effectively distributing requests among them?

Score: 4/10

Your Answer • 00:13:05 Insights

Okay. So, like, eighty like, eighty percent of the CPU and the memory. Same goes for memory, eighty five percent maybe. If it is that's a threshold, basically. So if that if that exceeded, we created an another board and talking about how and what's the question we'll be of. We almost want to start. And talking about eventually I know that load balancing or effective request among them. Yeah. Like, again, let me just read the question. How did you and that this load balancing was effective distribution request among them? If you if you if you can imagine, like, there are there are main two parts and there are so much of load and cannot eventually do that, but we eventually have six GB RAM. So, yeah, we can eventually create a new port of two GB RAM giving that port another two GB RAM and or maybe one GB RAM depending on our case. Or or or or in our project. So, yeah, it's just yeah. That's it. Like, obviously, have, you know, memory. So it was just using what what do you say? Maybe horizontal scaling Yeah. We can say that.

Improve clarity and structure when explaining technical details. Practice articulating specific thresholds and methods used in load balancing and scaling to provide a more comprehensive answer.

Veda AI • 00:13:08

Q11 Thank you for sharing your insights, Sagar. Before we finish, is there anything else you'd like to share about your qualifications or experiences that we haven't covered yet?

Score: N/A

Your Answer • 00:13:39

Yeah. The main project was just like you haven't covered about that. The man Like, that's the biggest project upgrade. Among the interview and the other projects. At all. And the achievement you are doing even discuss over the achievement too. What the heck, man?

Veda AI • 00:13:43

Q12 I appreciate your enthusiasm, Sagar. If you'd like to briefly summarize your main project and any key achievements, I'd be happy to hear about them.

Score: 6/10

Your Answer • 00:14:36 Insights

Talking about my choice slip, it's basically in library which I created it. And published in the published in the NPM, old package manager, and it has over two two thousand downloaders within last six months, and it is the basically, that library executes the test cases. Which can, like, which have put three, like, three languages supported. That is Java, c plus plus, and Python within within two minutes, it can execute execute over two lakh test cases. This is that is very highly scalable. And yeah, that's it.

To improve, the candidate should elaborate on the technical architecture, key challenges they encountered while developing the library, and any quantifiable impacts or outcomes from its usage, such as performance improvements or user feedback.

To improve, the candidate should elaborate on the technical architecture, key challenges they encountered while developing the library, and any quantifiable impacts or outcomes from its usage, such as performance improvements or user feedback.
